Manage Your Device Intensive Network
Securely and Seamlessly

CONNECTIVITY

In today's state of technology one of the most crucial components to large public venues and the success of events is the venue's ability to provide strong and seamless wireless connectivity.

This is extremely important when you have hundreds or thousands of unique devices all demanding service simultaneously. Your ability to achieve this in a venue becomes very clear when the demand is high.

Your venue's policy of an open bring-your-own-device (BYOD) environment will be tried and tested. Our platform will ensure that you can deliver the service your users are demanding.

CONTROL

Another major component to the complex problems facing venues is not only their ability to provide connectivity, but their ability to actually control the devices that are on the provided network.

Once deployed Engage Portal provides your network administrator deep control over each unique device independently. Engage Portal has been developed with security as the foundational function to operation.

- Detection, Isolation and Remediation of any abnormal network activities.
- Authentication and Registration to provide simple access.
- Administration is made simple with a browser based GUI.

CURRENCY

The connectivity and control of a network represent hard dollars, both in operation and profitability. Engage Portal enables an organization to not only protect their technical investments, but also monetize their infrastructure.

In most cases, a network meant for public use is not being utilized to it's fullest potential. This in itself is causing waste. Big Red Pin has extensive experience transforming simple network access into bottom line revenue.

Your guests to your venue are your number one asset to your organization. We will work with you to deliver the best possible technological experience to your guests. By doing this we not only drive new revenue, but protect the existing.
